

Ecological and Silvicultural Strategies for Sustainable Forest Management

Recognizing the increased interest in forest management world wide, this book addresses the current knowledge gap by defining sustainable forest management, clarifying methods by which ecological knowledge can be applied and how traditional silvicultural methods can be improved. Sustainable forest management involves the enhancement of various aspects of forest functions such as conservation of biodiversity, conservation of soil and water resources, contribution to the global carbon cycle as well as wood production. To establish ecological and silvicultural theories to enhance these functions harmoniously, recognizing the relationship between stand structures and their functions is essential. This volume presents target stand structures for aimed forest functions in relation to stand development stages, as well as ecological and silvicultural methods to lead and maintain them. Ecological and silvicultural strategies are discussed, both on stand and landscape levels, and from local to international levels in temperate and boreal forest zones.
