Natural Rubber Materials: Volume 2: Composites and Nanocomposites (RSC Polymer Chemistry Series)

The combination of its unique morphology, physical properties, cost effectiveness and environmental friendliness make natural rubber an appealing constituent for many materials and applications. comprehensive two volume set covers the synthesis, characterization and applications rubber based natural blends, interpenetrating polymer networks, composites and nanocomposites. Volume 1 covers different types of natural rubber-based blends and IPNs as well as manufacturing methods, thermo mechanical characterization techniques, life cycle analysis and their applications. Volume 2 focuses on natural rubber-based composites and Nanocomposites including different types of fillers, filler-matrix reinforcement mechanisms, manufacturing techniques, and applications. This is the first book to consolidate the current state of the art information on natural rubber based materials with contributions established international experts in the field. The book provides a one stop reference resource for professionals, researchers. industrial practitioners, graduate students, and senior undergraduates in the fields of polymer science and engineering, materials science, surface science, bioengineering chemical engineering.
