

Evolution of the House Mouse (Cambridge Studies in Morphology and Molecules: New Paradigms in Evolutionary Bio)

The house mouse is the source of almost all genetic variation in laboratory mice; its genome was sequenced alongside that of humans, and it has become the model for mammalian speciation. Featuring contributions from leaders in the field, this volume provides the evolutionary context necessary to interpret these patterns and processes in the age of genomics. The topics reviewed include mouse phylogeny, phylogeography, origins of commensalism, adaptation, and dynamics of secondary contacts between subspecies. Explorations of mouse behavior cover the nature of chemical and ultrasonic signalling, recognition, and social environment. The importance of the mouse as an evolutionary model is highlighted in reviews of the first described example of meiotic drive (t-haplotype) and the first identified mammalian speciation gene (Prdm9). This detailed overview of house mouse evolution is a valuable resource for researchers of mouse biology as well as those interested in mouse genetics, evolutionary biology, behavior, parasitology, and archaeozoology.

Eurasian house mouse (*Mus musculus* L.) differentiation at Editorial Reviews. Book Description. Featuring contributions from leaders in the field, this Evolution of the House Mouse (Cambridge Studies in Morphology and Molecules: New Paradigms in Evolutionary Bio, 3) - Kindle edition by Milos **Eurasian house mouse (*Mus musculus* L.) differentiation at** Cambridge Studies in Morphology and Molecules: New Paradigms in Evolutionary Biology SERIES EDITORS Professor Russell L.
