

## Yeast Biotechnology

Biotechnology is now established as a major area of technology, concerned with the application of biological organisms, systems or processes to manufacturing or service industries. Although the exploitation of organisms by man is not new, many of the techniques which are stimulating the rapid advances in biotechnology have developed from recent scientific discoveries. Throughout history man has, knowingly or not, been exploiting yeast in the production of alcoholic beverages and bread, and these processes still represent major biotechnological industries. The brewers and bakers yeast *Saccharomyces cerevisiae* is, however, also a favoured organism for the production of many new biotechnological products.
